Re: WT Docket No. 16-421

I am very concerned about the proposed 5-G wireless communication technology infrastructure build-out being proposed in the above-referenced docket. The proliferation of radio-frequency radiation in our mist is dangerous, as numerous scientific studies have shown for years.

Recently, a 2016 study by the National Toxicology Program shows that the increasing presence of radio waves, particularly high-frequency waves typical of cell-phone technology, causes cancerous tumors in the heart and brain. Since these radio waves would be everywhere, those of us who do not want to be exposed to this carcinogenic technology have no escape.

Therefore, I vehemently oppose allowing this technology to proliferate in the United States of America, my beloved country of origin and residence.

I also want my local governments to have the authority to override any other agency's regulations that might allow proliferation of 5-G cell-phone radio technology into my area.

The proposed network of antennas would expose all living animals, including humans, to dangerous levels of high frequency radio-spectrum radiation. This includes pregnant women, infants, children just starting their lives, the elderly, as well as all adults. Most of these people will be unsuspecting of the invisible dangers in their environment. Animal life, including farm animals, bees, pets, and all wildlife would all be put at serious risk.

All people are vulnerable to this threat. All of you who are reading this are human beings, just like the rest of us. YOU TOO would be exposed to these dangers. Do YOU want to increase YOUR chances of YOU AND YOUR FAMILIES getting cancer? And dying?

I ask that you deny any and all requests of any individual, group, or industry that wants to build this overwhelming radiation-producing wireless infrastructure in our country, to protect an unsuspecting and vulnerable public and other life forms from further radiation exposure.

Respectfully,

David Mehren
